PROFESSIONAL SUMMARY

Full Stack Software Development graduate with hands-on experience architecting and deploying secure, role-based web applications using C#, ASP.NET Core, Angular, and SQL Server. Skilled in designing systems end-to-end — from relational schema design through REST API development to production deployment on Azure — gained by building real, production-bound software used by actual teams.

TECHNICAL SKILLS

Programming Languages: C#, Python, SQL, TypeScript

Backend & Data: .NET 8, ASP.NET Core Web API, SignalR (WebSockets), SQL Server, Firebase Firestore, JWT Auth, Role-Based Access Control, Entity Framework Core, OOP & DSA

Frontend: Angular, Node.js, HTML5, CSS3, Bootstrap, React

Cloud & DevOps: Microsoft Azure, CI/CD, Docker & Kubernetes, Git, GitHub

AI-Assisted Development: Using GitHub Copilot and Claude to accelerate debugging, generate boilerplate, and review code quality during active development

Testing & Tools: xUnit/NUnit, Postman, VS Code, Visual Studio, Agile/Scrum

PROFESSIONAL EXPERIENCE

Junior Full Stack Developer | Care Insurance & Finance Ltd., North York, ON

May 2026 – Present

- Led end-to-end development of a full-stack Task Manager CRM used internally to manage 5,000+ client records, working in an Agile/Scrum environment with daily standups and sprint tracking in Jira.
- Built the Angular frontend with reusable components, Reactive Forms, and RxJS-driven services for HTTP communication with the backend API.
- Developed the ASP.NET Core 8 (C#) backend in Controller/Service/Repository layers, using Entity Framework Core and LINQ for querying, joins, and aggregations across related tables.
- Designed a normalized SQL Server schema with T-SQL stored procedures, functions, and indexes to support efficient data retrieval at scale.
- Implemented JWT authentication and role-based access control across SuperAdmin, Admin, and Employee roles, including a shared company-wide task visibility view.
- Integrated SignalR (WebSockets) for real-time dashboard updates, an in-app chat feature for team communication, and email notifications for task assignment and status changes.
- Deployed the Angular and ASP.NET Core apps separately to Azure App Service with CORS configuration and set up CI/CD via GitHub Actions and Azure Deployment Center for automated builds on every push.
- Used AI coding assistants to speed up debugging of SignalR sync issues and generate repository/service-layer boilerplate, helping deliver the full system within a 4-month internship.
- Tested role-based access flows manually and validated REST endpoints with Postman prior to deployment.
- Built an "All Tasks" view giving every user, regardless of role, company-wide visibility into active and in-progress tasks, alongside role-specific access for SuperAdmin, Admin, and Employee users.
- Configured environment settings and CORS across the Angular and API deployments, seeded the initial SuperAdmin account through SQL with a hashed password, and synced the codebase to the company's Git for production use.

Environment: Angular 18, TypeScript, RxJS, SignalR, ASP.NET Core 8, C#, Entity Framework Core, SQL Server, JWT, Microsoft Azure App Service, GitHub Actions, Git, Postman

Frontend Developer Intern | RK Web Soft Technology, India

Dec 2023 – Apr 2024

- Built a full-stack Employee Attendance and Leave Management System with Angular and ASP.NET Core Web APIs.
- Implemented REST endpoints in C#/ASP.NET Core for employee records, attendance tracking, and leave request workflows, backed by Entity Framework and LINQ against SQL Server.
- Added Angular Reactive Forms for client-side validation and structured DTO-based error handling across frontend and backend to keep data consistent.
- Developed Angular components and services that consume the REST APIs to display employee records, record attendance, and submit and review leave requests.

Environment: Angular, TypeScript, ASP.NET Core, C#, Entity Framework, Microsoft SQL Server, RESTful APIs, Git

PROJECTS

MediCare — Full-Stack Healthcare Management System

Angular, TypeScript, C#, ASP.NET Core, .NET 8, EF Core, SQL Server, REST APIs, JWT, SignalR, Git/GitHub

- Transformed an existing CRM application into a healthcare management platform using Angular/TypeScript, ASP.NET Core Web API, C#, Entity Framework Core, and SQL Server, following layered architecture principles.
- Built responsive Angular dashboards and reusable components for patient, doctor, appointment, medical-record, prescription, notification, and reporting workflows with REST API integration.
- Implemented CRUD operations, DTOs, dependency injection, JWT authentication, role-based authorization, validation, Swagger/OpenAPI, SQL Server data access, and asynchronous C# services.
- Integrated SignalR real-time notifications, background services, centralized API middleware, and Git/GitHub workflows for maintainable full-stack development.
- Leveraged GitHub Copilot and AI coding assistants for backend/frontend scaffolding, refactoring, debugging, API integration, architecture migration, and documentation, while reviewing, testing, and adapting generated code.
- Designed the dashboard UI and layout, and structured the backend with Clean Architecture (Api, Application, Domain, and Infrastructure projects), applying Entity Framework Core migrations to build the SQL Server schema.

Cloud-Integrated Expense Tracker

Python, Flask, Firebase Firestore, Matplotlib, Pillow

- Built a Flask web app with Firebase Firestore for real-time expense storage and sync between client and database.
- Implemented expense entry, editing, and category management, with Matplotlib-generated charts to visualize by category.
- Used Pillow for image handling and applied client-side validation to keep entries clean before writing to Firestore.

EDUCATION

Full Stack Software Development, Lambton College, Sarnia, ON

August 2026

Bachelor of Computer Applications, Dharmsinh Desai University, Gujarat, India

April 2024
